Open access means making research publications freely available online. If a journal article or other research output is open access it means that, by the consent of the author or copyright-holder, it can be freely accessed by anyone in the world using an internet connection.

Why Open Access?
If a journal is available online this does not mean it is freely available: universities pay large subscriptions to provide access to journals online. In recent years, massive rises in journal prices have meant that most university libraries can no longer afford subscriptions to all of the journals that their researchers need for their work.

The open access movement is a worldwide effort to provide free access to publicly-funded research results. A milestone was the Berlin Declaration on Open Access to Knowledge in the Sciences and Humanities of October 2003.

Benefits of Open Access
- Authors retain copyright
- Increased visibility and higher citation rates
- Worldwide unrestricted access to your research without technical or financial barriers
- Promotes international and interdisciplinary cooperation
- Greater opportunity to do more with your own research outputs

Open Access Strategies
There are two types of open access:

1. **The Green Road** to open access refers to the self-archiving of digital documents in a repository either parallel to or after publication in a toll-access journal. A list of open access repositories can be found in OpenDOAR and the Registry of Open Access Repositories (ROAR).

   ![reposiTUM](https://www.ub.tuwien.ac.at/openaccess)

   The institutional repository of the TU Wien can be found on www.ub.tuwien.ac.at/openaccess.

   The SHERPA/RoMEO Listings provide information on the self-archiving policies of publishers. Authors should supplement their publishing agreements with contract addenda which enable them to provide open access to their work or to avoid embargo periods.

2. **The Golden Road** stands for the primary publication of scientific articles in an open access journal. The „Directory of Open Access Journals“ provides a list of quality open access and peer-reviewed journals: www.doaj.org.

   The copyright remains with the author and the articles are freely available to everyone. Many of these journals are charging the author a publication fee, also known as an article processing charge (APC).

   The Library offers financial support for specific open access publications.

Support at the TU Wien

General Guidelines for the Funding of Open Access Publications
1. The article has to be published in an open access journal. The journal must be listed in the „Directory of Open Access Journals“ and must use strict quality control such as peer review.
2. The article processing charge (APC) may not exceed 2.000 €.
3. Submitting/corresponding authors have to be staff members of the TU Wien. They are required to acknowledge the funding in the publication and to enter the publication in the TU publication database.
4. If a research funding agency (e.g. FWF) offers to cover open access publication costs, the TU Wien will not provide any additional funds.
5. The TU Wien does not cover any publication fees for publications in subscription based journals with open access option.

Publishing Support
1. The TU Wien currently covers article processing charges (APCs) for the following publishers:
   - BioMedCentral: www.biomedcentral.com
   - Springer Open: www.springeropen.com
   - ChemistryCentral: www.chemistrycentral.com
   - IEEE Open: open.ieee.org
2. Special open access agreements with publishers (hybrid open access):
   - Springer Compact: TU researchers can publish open access articles in more than 1600 Springer Open Choice journals without paying a publication fee.
   - Royal Society of Chemistry (RSC) Gold for Gold: The Library’s licence contract includes vouchers for open access articles. Using these vouchers, open access articles can be published on the RSC platform without any additional fees.
